Full Stack Software Developer

Software Developer with hands-on experience building full-stack and backend applications across Python, Java, C#, and JavaScript. Skilled in Spring Boot, ASP.NET Core, Django, React, REST APIs, and database design with MySQL, PostgreSQL, and MongoDB. Experienced in Docker-based deployment, Git workflows, testing, and role-based authentication using Spring Security and ASP.NET Core Identity. Proven ability to deliver projects end to end, from UI development and business logic to data modeling, debugging, and release support

TECHNICAL SKILLS

- **Languages:** Java, Python, C#, JavaScript, SQL
- **Frameworks & Libraries:** Spring Boot, ASP.NET Core, Django, React, Thymeleaf, JUnit, xUnit, Flask
- **Databases:** MySQL, PostgreSQL, MongoDB, Qdrant
- **Tools & Platforms:** Git, GitHub, Docker, AWS, Visual Studio, VS Code, Postman
- **Security & Authentication:** Spring Security, ASP.NET Core Identity, JWT, role-based access control, protected routes
- **Core Concepts:** Object-Oriented Programming, Data Structures and Algorithms, Database Management, REST APIs, SDLC, Full-Stack Development

PROFESSIONAL EXPERIENCE

SES Inc

Sep 2024 - Sep 2025

Software Developer Intern

- Improved a Python desktop application used by engineers to estimate capital costs for industrial plants by building and refining features across the UI, business logic, and data layers; validated changes through testing and internal review.
- Helped replace manual spreadsheet-based estimating workflows with faster software-driven workflows by implementing features that handled equipment, piping, and structure cost data more consistently; confirmed impact through smoother user workflows and fewer manual steps.
- Strengthened the usability of the estimating tool by developing and troubleshooting user-facing interface components, improving the experience for engineers working on high-stakes project budgets; verified results through direct feedback and successful feature demonstrations.
- Supported end-to-end feature delivery in a small startup environment by writing Python across the stack, fixing bugs, and iterating quickly with the team; ensured reliability through code review, regression testing, and stable releases.
- Contributed to a commercial launch product by working on software that helps teams produce faster, more rigorous capital cost estimates for large industrial facilities; proof of impact came from completed features and working builds delivered to the team.

Capstone Project – Detective Interrogation Game Prototype

April 2026

- Built a 3D detective interrogation game where a Unity frontend talks to an ASP.NET Core (.NET 8) backend over HTTP, with the backend acting as the authoritative progression and dialogue engine.
- Implemented layered backend architecture (controllers, services, progression engines, repositories, persistence stores) to manage sessions, clue clicks, and dialogue turns cleanly and testably.
- Designed a PostgreSQL schema for players, NPCs, progression sessions, interactions, lore, and intent catalogs, plus Redis caching and Qdrant vector search, then wired it via Entity Framework Core migrations and Python seeding scripts.

-
- Integrated ONNX embeddings and Qdrant to classify player dialogue into intents (e.g., questions, evidence, empathy, contradiction) and optionally used an LLM endpoint to generate suspect responses within backend rules.
 - Orchestrated the full environment with Docker Compose for PostgreSQL, Redis, and Qdrant and documented setup, configuration, and troubleshooting so teammates and evaluators could run the complete stack.

Campus Job Board – Java/Spring Boot

January 2026

- Developed a role-based campus job board where students browse and apply for jobs, employers post openings, and admins moderate listings, using Java, Spring Boot, Spring Security, JPA/Hibernate, MySQL, and Thymeleaf.
- Implemented secure authentication and authorization with distinct roles (STUDENT, EMPLOYER, ADMIN), custom exceptions, and a global exception handler to enforce rules and improve error handling.
- Wrote unit tests for service logic (e.g., preventing duplicate applications, validating job state transitions) using JUnit 5 and Mockito to catch issues before integration.
- Containerized the application with Docker (and Docker Compose) to run the Spring Boot API and MySQL together, enabling consistent local and deployed
- Styled responsive pages for home, login, registration, job listings, and dashboards using Thymeleaf fragments, HTML, and CSS to deliver a polished UI suitable for grading and portfolio review.

EDUCATION

Computer Programming Developer -Red Deer Polytechnic, Canada - 2023-2026
